

# Trailer Cube

It is critical to be accurate when defining Trailer Cube (cube utilization) when closing a trailer. Also, critical when informing the Linehaul Department or Weights & Inspections Department of cube used on a trailer that is not closed.

Below is a simple chart to show you how to determine what the cube utilization on a trailer would be.

## Examples:

- Floor loaded (not stacked) to the rear = 50% Cube, 0 feet left
- Floor loaded to the rear and maybe 4 skid spaces in the nose are stacked high or are tall skids that take up all of the cube in that 4 skid spaces = 60% Cube, 0 feet left

Along with TRAILER CUBE, it is critical that an accurate reading of the FEET LEFT on the trailer be reported also. As you can see in the examples above, the *CUBE* may be 50% or 60%, but the FEET LEFT is 0.
